MT readout: first population-model search
A. Gain recovery: original predictors
Probe / drift gain
Probe offset (degrees)
Observed
Starting MT p=5
p=5, changed noise/readout
Exploratory alternative
B. Same noisy increment trials
Fraction correct
Probe offset (degrees)
C. Exponents do not transfer directly
Evidence relative to single stream
p=5 on stimulus streams
p=5 on full MT responses
100/0/0
70/15/15
50/25/25
Equal thirds
Allocation of a fixed total increment
Panels A/B: 120° uses randomized IDQ; other offsets use IDS. Altered-noise curves use positive-minus-negative unit-change pools.
